Abstract of JP 10198735 (A)

PROBLEM TO BE SOLVED: To show individual stock option brand in the current code width range by showing the number expressing month and data of a bit by a code that shows a number, which is obtained by adding a specific number to the number showing month. SOLUTION: The month and data of a bit are shown in a code showing a number obtained by adding an integer N larger than 0 to the number showing the month and a code showing a number obtained by adding an integer M (M>=N+12) to the number showing the month. In this coding method, one of two prescribed numbers is added to the number showing the month for coding the data on the number showing the month and a bit into a numeric character of two digits. For instance, a number 50 or 0 is defined as a bit 1 or 0 respectively to show August and the bit 1 in '58' and to show August and the bit 0 in '08'. At the same time, 50 is added to a number showing the expiration month to show the buying right of the relevant brand. Furthermore, the expiration month itself is notated to show the selling right of the brand.
